Risk configuration [?](#)

You can define a name for Risks axis and set corresponding custom field below. If you want to configure specific field's name and levels (visible also on Jira issue page), go to [Custom fields](#) configuration.

PROBABILITY LABEL	<input type="text" value="PROBABILITY"/>
PROBABILITY FIELD	<input type="text" value="Risk probability (customfield_10106): Risk Probability field used by BigPicture pl..."/> ▼ <small>The probability of harm occurring</small>
CONSEQUENCE LABEL	<input type="text" value="CONSEQUENCE"/>
CONSEQUENCE FIELD	<input type="text" value="Risk consequence (customfield_10105): Risk Consequence field used by BigPict..."/> ▼ <small>The harm severity</small>

Configuring the risk matrix

A risk matrix is a matrix that is used during risk assessment to define the level of risk by considering the category of probability or likelihood against the category of consequence severity.

You can change the axis description as well as the synchronized Jira fields.

By default, two "Select list (single choice)" custom fields are created during the app installation:

Custom field	Select options
Risk consequence	<ul style="list-style-type: none">• Trivial• Low• Medium• High• Severe
Risk probability	<ul style="list-style-type: none">• Almost none• Low• Medium• High• Very high

 In order to use the matrix i.e. show Jira issues on the matrix you need to add both fields to your Jira issue screens and select one of the options.
